

Asia before Colonial Times

Francis Bond

after the slides of František Kratochvíl

2026

Acknowledgement

- These slides are a re-typeset version of **Asia before Colonial Times** by **František Kratochvíl**, given for *Lingvistika asijských jazyků* (DAS/LAS) on 18 February 2021.
- The figures are his, or are reproduced in his slides from the sources named on each slide and listed at the end.
- Rebuilt here in the format of the rest of the course so that it can be maintained and revised alongside the other weeks. Any errors introduced in the rebuilding are mine.
- Thanks to František for making the material available.

Overview

- 1 Language Families of Asia
- 2 Geography and Climate
- 3 Crops and Domestication
- 4 Lexical Borrowing

Major languages of Asia

Austro-Asiatic family

Hmong-Mien family

Hmong-Mien family

Tai-Kadai family (now a branch of Austronesian)

Sino-Tibetan family

Sinitic branch

Altaic hypothesis

The integrity of the Austronesian language family

Relief of East and Southeast Asia

Relief of mainland Southeast Asia

Monsoon patterns

Cultural crops

Last glacial period sea levels and natural refugia of wild rice

Genetic diversity of rice

Domestication pressures on rice

Fuller 2011

Spreading of rice hybrids

Fuller 2011

Spreading of rice hybrids

Major population growth
Pushed Indo-Aryan to dominance;
State-formation; Dispersal to Ceylon

Rice-based Dravidian & Maharati
State-formation

Reconstruction of Austronesian expansion

Millets

Suggested Migration Route for Early Austronesians Into and Out of Taiwan and the Worldwide Distribution of Haplogroup E1 (A) Geographic regions in China of foxtail millet domestication (source: Ko et al. 2014)

Taro domestication

Multidisciplinary investigations at Kuk Swamp in the Highlands of Papua New Guinea show that agriculture arose independently in New Guinea by at least 6950 to 6440 calibrated years before the present (cal yr B.P.). Plant exploitation and some cultivation occurred on the wetland margin at 10,220 to 9910 cal yr B.P. (phase 1), mounding cultivation began by 6950 to 6440 cal yr B.P. (phase 2), and ditched cultivation began by 4350 to 3980 cal yr B.P. (phase 3). Clearance of lower montane rainforests began in the early Holocene, with modification to grassland at 6950 to 6440 cal yr B.P. Taro (*Colocasia esculenta*) was utilized in the early Holocene, and bananas (*Musa* spp.) were intensively cultivated by at least 6950 to 6440 cal yr B.P.

Taro domestication

New Guinean domestications: tubers

Yams (*Dioscorea alata*)

Amorphophallus

Colocasia

Cyrtosperma

Alocasia

Xanthosoma

Taro (*Araceae*) and *Amorphophallus*

New Guinean domestications: sago

New Guinean domestications: banana

Over 100 new accessions of wild and cultivated bananas were obtained from a wide geographic region including West New Britain, East New Britain, New Ireland, Western Highlands, East Sepik, Madang and Milne Bay

New Guinean domestications: sugar cane

Cultural crops and language family expansions
